Sir,

Gouty tophi present themselves as firm and skin-colored or yellowish papules or nodules with white chalky material. They may appear in any location on the body, but appear most commonly in the interphalangeal joints [1]. Clinically, they may resemble calcinosis cutis, rheumatoid nodules, xanthomas, and panniculitis. They indicate a chronic foreign-body granulomatous response to monosodium urate crystal deposits in the dermis and the subcutaneous tissue, and classically occur with untreated chronic gouty arthritis. Very rarely, in the absence of arthritis, they may be the first clinical sign of gout, which is known as gout nodulosis [2].

A 53-year-old male presented himself with multiple asymptomatic swellings over both ankles and feet persistent for four years prior. The patient had a history of depigmented patches over the face, hands, feet, and genitals since childhood, but no arthritis. His father and younger sister had vitiligo as well. The patient had been alcoholic for ten years and hypothyroid for five years, and had been taking 50 μg levothyroxine sodium daily. The cutaneous examination revealed multiple skin-colored to erythematous, firm, and nontender nodules 1 × 1 cm to 4 × 5 cm in size, present over both lateral malleoli, the first metatarsophalangeal joint, the lateral border of the left foot, and the palmar surface of the right index finger and left thumb (Figs. 1a – 1c). Depigmented patches were present over the face, ears, the palmar and dorsal surfaces of the hands, both feet, the scrotum, and the penis with areas of repigmentation. The complete blood count, liver function tests, serum creatinine, the fasting lipid profile, T3, T4, and TSH were normal. An abdominal ultrasound revealed left renal calculi with bilateral grade I renal parenchymal changes and grade II–III fatty changes in the liver. A radiograph of both ankles and feet showed soft tissue swellings with no evidence of erosion or joint space reduction. During a biopsy, chalky material came out from the nodule (Fig. 2). Histopathology showed compact hyperkeratosis, acanthosis, mild edema, and perivascular lymphocytic infiltrate in the upper dermis. The subcutaneous tissue was replaced by fibrillar hyaline pink material with palisading granulomas. Polarized microscopy of the chalky material proceeding from the biopsy site showed needle-shaped birefringent crystals, suggesting monosodium urate crystals (Fig. 3). This was further confirmed by a phosphotungstic acid test, in which the chalky material turned blue. Serum uric acid was high, at 8.2 mg/dL (normal range: 2.4–6 mg/dL). Serum calcium, phosphorous, and parathormone were normal.

Gouty nodules without chronic arthritis are very rare [3,4]. They may occur with renal insufficiency, hyperparathyroidism, or in patients receiving anti-inflammatory or diuretic drugs for a longer time. Our patient had hyperuricemia, but not renal problems, and had not received any anti-inflammatory or diuretic drugs. Also, his calcium and parathormone levels were normal. He developed gouty nodules with mild hyperuricemia, but with no arthritis and no other known cause of hyperuricemia. Kikuchi et al. reported hyperuricemia in vitiligo patients who have undergone narrowband UVB therapy. The immunomodulatory effect of UV radiation affects T lymphocytes, which attack melanocytes, resulting in increased nucleic
The increased uric acid levels might have been caused by the inflammation-mediated generation of IL-1. The NALP3 inflammasome is involved in gout, whereas the NALP1 inflammasome in vitiligo [7]. Hence, the association of vitiligo with gout might be inflammation-mediated and induced by prolonged UV radiation.

Consent

The examination of the patient was conducted according to the principles of the Declaration of Helsinki.

The authors certify that they have obtained all appropriate patient consent forms, in which the patients gave their consent for images and other clinical information to be included in the journal. The patients understand that their names and initials will not be published and due effort will be made to conceal their identity, but that anonymity cannot be guaranteed.
