Sir,

We have read with interest a recent report by Dahhouki et al. on a case of apocrine hidrocystoma in a rare location [1]. Herein, we describe an additional case of apocrine hidrocystoma that appeared on the scalp. The patient had a history of lung cancer, and a skin biopsy was performed to rule out skin metastasis.

An 80-year-old female, diagnosed with lung adenocarcinoma (pT1bN0M0, stage IA) two years before, was referred to our department complaining of an asymptomatic scalp nodule that appeared a few months prior to the referral. The lung cancer was surgically resected and the subsequent metastasis to the brain was treated with radiation. A physical examination revealed a smooth, dome-shaped, light blue nodule 1 cm in size on the scalp (Fig. 1). The patient had not received any treatment for the lesion. A skin biopsy was conducted to rule out skin metastasis. Histological features involved a cyst wall consisting of one to several layers of epithelial cells, some of which showing decapitation secretion indicative of apocrine secretion (Figs. 2a and 2b). The parietal cells did not show atypia and no inflammatory cell infiltration was observed. Immunohistochemistry demonstrated that the tumor cells were strongly positive for CEA and partially positive for 34βE12 (Figs. 3a and 3b), but negative for EMA, GCDFP-15, S-100, CK20, CAM5-2, and α-SMA. Therefore, a diagnosis of apocrine hidrocystoma was established.

According to an analysis of 167 Japanese cases conducted between 1968 and 2003 by Anzai et al. [3], tumors were most commonly found on the face (n = 102; 61.1%), followed by the trunk (23; 13.7%), the scalp (21; 12.6%), and the extremities (20; 12.0%). As far as we know, there have, since 2003, been three cases of apocrine hidrocystoma on the scalp [4-6]. One developed apocrine cystadenoma in a lesion associated with sebaceous nevus syndrome [4]. The other cases...
showed clinical features mimicking subcutaneous dermoid cysts [5] and a giant cell tumor [6]. We suggest that apocrine hidrocystoma ought to be considered as a differential diagnosis of cystic tumors on the scalp.

Consent

The examination of the patient was conducted according to the principles of the Declaration of Helsinki.
