

OUR DERMATOLOGY ONLINE

FOR AUTHORS

Ethical requirements for studies involving live human or animal subjects. Studies involving live human or animal subjects must have been approved by the authors' Institutional Review Board (IRB) or its equivalent. In the submission process, the author needs to acknowledge that a copy of the IRB approval letter must be included with the submission or sent to the editor for each article. Some articles can be IRB exempt if the patient identity is not shown. Some studies on archival biopsies can be IRB exempt also if the biopsy does not show any identifier that can be linked to the patients. The journal requires the IRB approval in the methods section of all manuscripts. Patients must not be identified by name or initials; only alpha-numeric values and or data should be used. No other information, including clinical photos or family trees, from which a patient could be identified is permitted unless express written permission from the patient/family is provided at the time of manuscript submission. All clinical investigations must have been conducted according to the Declaration of Helsinki principles. If the Methods section is not sufficiently clear, authors may be asked to provide the editors with a copy of IRB-approved research protocols for the use of our reviewers.
